

Gain a detailed overview of your backup estate for full visibility and to ensure it is configured to best practice.

Why Choose Autodata?

Autodata is a multi award-winning **Veeam Platinum VCSP Partner** that supports thousands of workloads and tens of thousands of users with their backup requirements , across all verticals

We have vast knowledge and experience in deploying and managing on-premise, virtual, cloud and M365 backup deployments in best practice and offer a wide range of professional services.

These means we are experts in Veeam deployments and can assist you with getting into a best practice state ensuring your data is protected.

Client Reference

“We have been running Veeam for a couple of years and felt it was time for a check-up on our environment to ensure we were keeping with best practice and getting the most out of our investment.

Autodata took the time to understand our business and use cases for Veeam with the process being smooth from start to finish. Once the health check had been carried out, we were provided a full report and the engineer who carried out the work talked us through the findings with Autodata’s recommendations being well justified and in-line with the best practices we had spoken about during our scoping meetings.

The work was valuable and has led us to moving more of our Veeam infrastructure and licensing over to Autodata.

ANTHONY WOOD
INFRASTRUCTURE & NETWORK MANAGER,
KILLIK & CO

Organisations are generating more data than ever. The 328 million terabytes of data currently created everyday is expected to increase to 181 zettabytes in the next two years.

Data is a critical resource for any organisation, forming the backbone of how you engage with your customers and run your everyday operations. Backing up your data is therefore crucially important, especially given the threat of cyber attacks. In 2023, 85% of organisations suffered at least one ransomware attack; **of which 93% had specifically targeted their backup repositories**. On average it took an organisation 3-4 weeks to recover from the attack, during which they suffered financial and reputational damage.

Having a strong backup solution in place deployed against a set of best practice guidelines is key to helping organisations recover quickly. Are you confident that you have your backup solution deployed correctly? Could you effectively recover your data if it was lost to a ransomware attack, corruption, or accidental deletion?

Autodata offers a **Veeam Backup and Replication Health Check** which analyses your backup environment to ensure you can be confident in recovering data should you need to.

What’s included?

Autodata will run a comprehensive analysis of your backup environment and you will be provided with a report covering:

- **An Overview of your Business Requirements with Backup /DR strategy**
- **Best Practice Analysis Results**
- **Recommendations**
- **A Detailed overview of your:**
 - **Backup Infrastructure**
 - **Backup Inventory**
 - **Backup Job Summary**

The Health Check has multiple stages: firstly we analyse your current environment; then we will the review the results and put together the report; before sharing and presenting the findings back to you.

Our Cloudlake Backup Health Check Report will either confirm that your Veeam deployment meets your business requirements or provide a list of recommendations to improve your deployment.
